

P701

Industrial inverters
 Inverter for air conditioners
 IGBT/Power MOS FET gate drive

P701 consists of a GaAlAs light-emitting diode and an integrated photodetector.

This unit is 6-lead SDIP package. The P701 is 50% smaller than the 8-pin DIP and meets the reinforced insulation class requirements of international safety standards. Therefore the mounting area can be reduced in equipment requiring safety standard certification.

The P701 is suitable for gate driving circuits for IGBTs or power MOSFETs. In particular, the P701 is capable of "direct" gate driving of low-power IGBTs.

Note 6: A ceramic capacitor (0.1 μF) should be connected from pin 6 to pin 4 to stabilize the operation of the high gain linear amplifier. Failure to provide the bypassing may impair the switching property.
The total lead length between capacitor and coupler should not exceed 1 cm.
